Working in Hindi,
on a phone

Lakhs of families have money waiting for them. They just do not know it.

₹1.84 L cr

unclaimed across banks,
insurance, PF and shares

[1]

₹72,454 cr

in old bank accounts alone,
parked with RBI

[2]

8.5 lakh

people have ever used RBI's
search portal, in a country
of 140 crore

[3]

₹38,700

average returned per family
in Gujarat's claim camps

[4]

Why it stays stuck: nobody knew it existed; it is spread across six separate portals, mostly in English; the rules are confusing, so agents take 5 to 15 percent; and accounts without a nominee become new unclaimed money every year.

Take a photo. Get your family's money back.

1 FIND

Photograph old papers, or upload the income tax statement. Virasat lists every place the family may have money, and the exact portal to search.

2 CLAIM

Three plain questions. A tested rule engine picks the route and generates the filled claim pack as a PDF.

3 TRACK

Status, next action, and a pre-written ombudsman complaint after 30 days of silence.

4 PREVENT

The Parivaar Vault records every account and checks that each has a nominee.

English and Hindi, by voice

Light and dark, phone and laptop

No sign up to try it

Four things that exist nowhere else

The tax statement becomes an asset map

A legal heir can get the account holder's Annual Information Statement. It lists interest from every bank and dividends from every company. Virasat turns that one PDF into a list of places to claim from, even with no papers at all.

The Two AI Debate

One AI argues for the route, a second hunts for what could go wrong, a third gives the verdict with reasons and risks. The referee can only make advice more careful, never overrule the rules.

Safety by separation

The AI reads, explains and translates. Every legal decision comes from a deterministic, versioned, unit-tested rule engine, so an institution can audit it.

Bring your own data, key and rules

A bank sends its own claim rules as JSON. Virasat applies them and records the rule version on every claim.

Two AIs argue, and you can read the argument

Supporter

The nominee route is correct: the passbook names a nominee and the amount is below the bank's threshold.

Challenger

The passbook says 'Sunita R Kulkarni'. Her ID may say 'Sunita Ramesh Kulkarni'. Banks reject claims on a spelling mismatch.

Referee

Nominee route. High confidence. Next step: carry an ID that matches the nominee name exactly, or an affidavit for the name variation.

What is actually built

READS AND WRITES

- Claude Opus 5 with JSON schema outputs
- AIS PDF tables parsed in code
- Claim packs built with pdf-lib
- Browser speech in and out

DECIDES

- Rule engine, 5 institutions
- Versioned and unit-tested
- Bring your own rules
- Debate can only raise caution

SERVES

- Next.js 16, React 19, TypeScript
- Public API with keys and limits
- RFC 9457 errors, playground
- Data stays in the browser

47

automated tests

0

serious axe violations

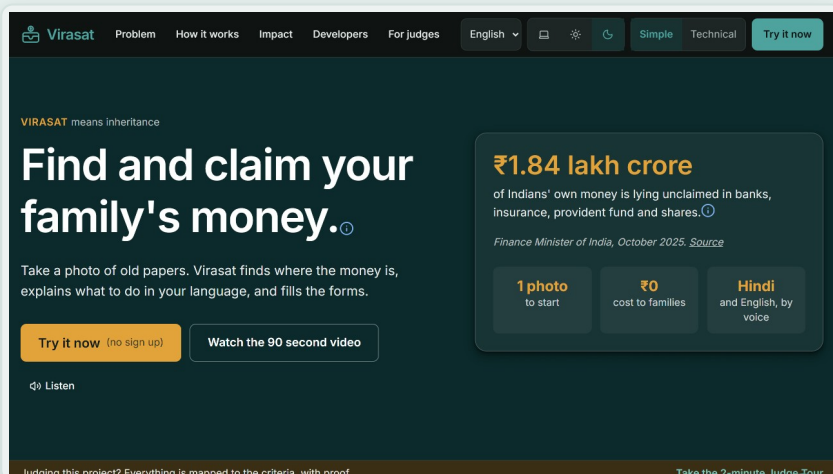

99 to 100

Lighthouse, desktop

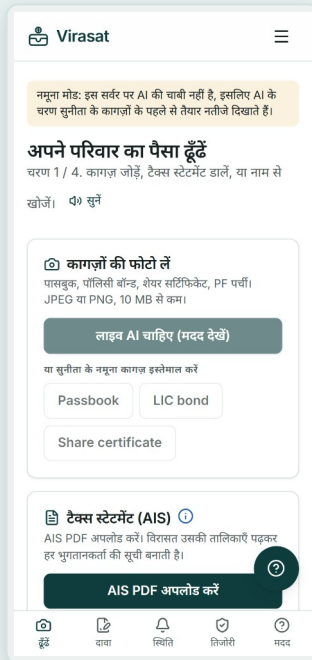

about ₹33

AI cost per family

Built for a cheap phone, in your language

Dark mode and Hindi are one tap from any screen.

Accessibility (axe, WCAG 2.2 AA)

0 serious or critical across 11 pages, light and dark

Lighthouse, live, 3 runs each

99 to 100 desktop, never below 90 on a throttled phone. 100 accessibility, best practices and SEO on both, and layout shift under a quarter of the 0.1 threshold.

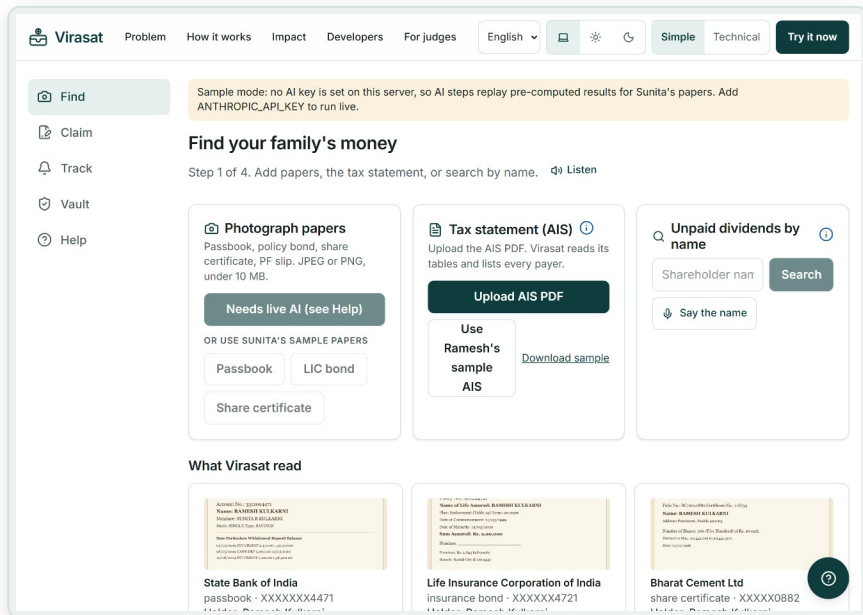

Works with no signal

Installable. A service worker keeps every opened page, the Vault and the glossary working offline, and says which steps are waiting.

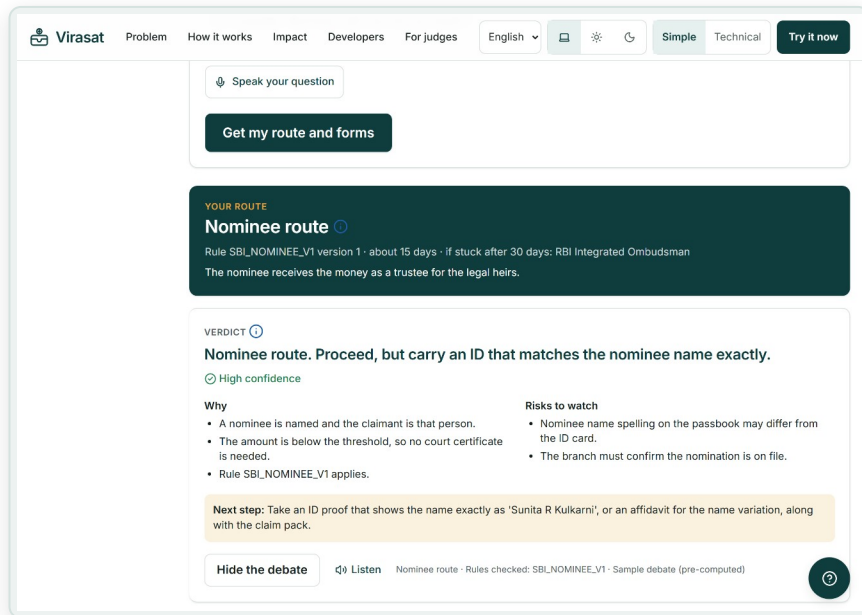

Languages and reach

English and Hindi on every screen including the rule output and the debate. 320 px, 44 px controls, voice in and out, no sign up.

This is the working product, not a mock-up

Find: three sample papers and the tax statement become a list of ₹4.85 lakh waiting in 5 places, each with its own portal and guided steps.

Claim: the rule engine picks the route, the Two AI Debate checks it, and the filled claim pack downloads as a PDF.

What changes for one family, and for the country

For ₹4.2 lakh owed	Today	With Virasat
Agent's cut (5 to 15%)	₹21,000 to ₹63,000	₹0
Time on paperwork	Months of office visits	Forms ready the same day
Chance of missing money	High: nobody knows what exists	Low: the tax statement shows every bank

₹184 crore

back to families if just 0.1 percent of the pool is claimed

₹38.7 crore

saved in agent fees if we help 1 lakh families

about ₹33

of AI per family, measured from real token counts, against ₹38,700 returned on average. Roughly 1,150 rupees recovered per rupee spent.

Adding a bank is adding one file

How it earns: free for families. Banks and insurers pay, because regulators push them to clear unclaimed balances. Service centres charge a small fixed fee instead of an agent's percentage.

START

1 district

Service centres and one bank.
Count the money returned
every week.

STATE

All institutions

A rule file per bank, insurer
and fund house.

INDIA

22 languages

DigiLocker and Account
Aggregator. Join the RBI and
IRDAI campaigns.

WORLD

Beyond India

NRI families, and countries
with similar unclaimed money
programmes.

₹33 a family, open rules, and every number checkable

What one family costs

Reading 3 photographed papers ₹5.17

Two AI reviewers, 3 claim routes ₹14.82

Tax statement, rules, claim packs free

One family, end to end ₹19.99

Most of the journey costs nothing per family, because most of it runs in ordinary code. The AI is used only to read a photograph and to argue about a route.

The rules are open

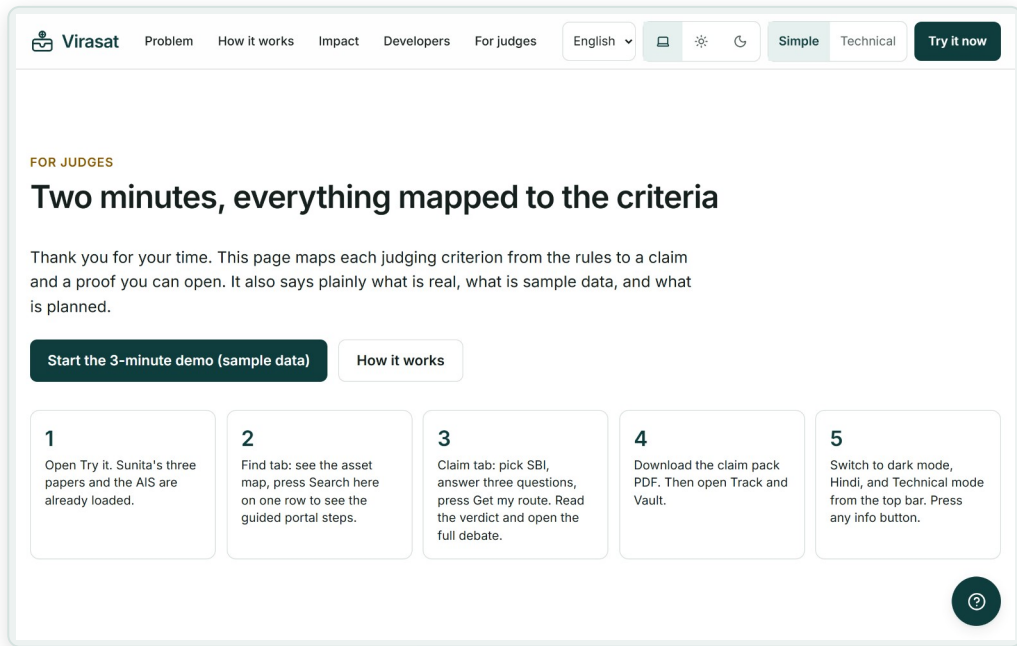

The claim procedure of each institution, as machine readable data. Served with no key, MIT licensed, at `/api/v1/rules/corpus`. If a bank or a government portal takes it, that is the point. We would rather be the standard than the site.

Every number is checkable

One command, `npm run audit`, re-runs accessibility on every page in both themes, Lighthouse three times on two profiles, the tests and the build, then writes the report including whatever failed.

It goes down, not up, with scale: overnight work moves to the Batch API at half price, and a clear printed passbook does not need the largest model. About ₹4 a family at the lowest setting.

Every criterion mapped to proof you can open

- A 2-minute guided tour of the live product.
- A table mapping each criterion and weight to a claim and a link.
- An honest list: what is real, what is sample data, what is planned.
- Every deliverable Rules.md asks for, with a link.
- One click resets the demo for the next judge.

Open `/judges` on the live site.

The next three things we build

WhatsApp and more languages

The same engine behind a WhatsApp number, plus Marathi, Tamil, Telugu and Bengali, so families who never open a website can still use it.

DigiLocker and Account Aggregator

Fetch certificates directly and, with consent, read bank data through India's account aggregator framework, so the search step disappears.

The service centre network

A helper dashboard for the 5 lakh Common Service Centres, so one trained operator can run claims for a whole village.

Aapki Poonji, Aapka Adhikar.

Your money, your right. Virasat is the layer that gets families to it, in their own language.
